

Ian Hoyer stands next to the crown where we dug a snowpit and investigated the snow structure. The crown averaged 4-5 feet deep. Near his right knee is the layer of weak faceted snow that broke 40 cm above the ground. Above this layer was a thick slab of windblown snow. Photo: GNFAC

Advisory Region Cooke City Longitude -109.95W Latitude 45.06N

Avalanche Details: Double Avalanche Fatality, Scotch Bonnet Mountain
