 Co-ord: **45.06706 N 109.95652 W**  
 Slope: **26**  
 Wind loading: **no**

Stability on similar slopes: **Very Good** **PS4 HS46**  
 Air Temperature: **C**  
 Sky Cover: **Clear**  
 Precipitation: **None**  
 Wind:

Layer notes:  
**42-46: Problematic Layer**

Notes: Northerly aspects have fx's. Southerly aspects have more melt freeze and less snow. NSF's on surface could be the problem with the approaching storm. I was surprised how well developed the fx's at 25-16cm were. Not like last year, but not too bad. Despite the warm weather, I think the week+ of high pressure has helped drive the faceting process with some really clear nights. We'll see what happens in the next month or so.
